

Fresh Market Potatoes Yields Boosted with AgroLiquid

North Central Research Station, St Johns, MI 2012

Better Yields with two Nitrogen options... Improved yield in all Grades

Nitrogen Options from AgroLiquid

- High NRG-N™ was applied at 60% of the 28% UAN for the conventional program. This is the lowest volume of Nitrogen to meet the needs of the Russet Norkota crop.
- Adding eNhanse™ to 28% UAN allows the application volume to be reduced to 80% of the Conventional treatment volume and still meet the needs of the crop.
- All the potatoes received ~ 50 lbs of nitrogen at planting and the remainder was divided into two side-dress applications.
