

Higher Yields start with AgroLiquid in the transplant solutions. But don't forget fertiRain!

Start to finish, Your watermelons yield better with AgroLiquid

- Transplant solutions (setter water) can be the first fertilizer application many plants receive. Utilizing products with low salt-index values can promote early establishment for higher yield potential. Pro-Germinator™, Sure-K™ and Micro500™ can provide low salt, nutrient balanced applications for pre-plant bands, transplant solutions, or drip irrigation nutrition for your crops.
- Foliar applications of fertiRain with normal pesticide treatments also benefit vine crops yields
- The major application of nutrients for these comparisons were applied pre-plant, see the 2012 research report for complete details on these and other fertility comparisons.
